AGENDA

CONCEPT OF ORGANIZATION

CONCEPT OF BEHAVIOR

ORGANIZATIONAL BEHAVIOR (OB)

CHARACTERISTICS OF OB

MODELS OF OB

What is an Organization?

- Organization refers to a collection of people, who are involved in pursuing defined objectives. It can be understood as a social system which comprises all formal human relationships. The organization encompasses division of work among employees and alignment of tasks towards the ultimate goal of the company.
- Organization is a goal oriented process, which aims at achieving them, through proper planning and coordination between activities. It relies on the principle of division of work and set up authority-responsibility relationship among the members of the organization.

Definitions

- Mooney & Reiley (1938)
 - Organization is the form of every human association for the attainment of a common purpose.
- Stephen P. Robbins (2000)
 - Organization is a consciously coordinated social unit, composed of two or more people, that functions on a relatively continuous basis to achieve a common goal or set of goals.

Concept of Behavior

- Behavior is a series of activities that human does. It is the sum total of human activities that could be observed by others. The activities can be walking, taking, eating, sleeping, walking and the like.
- Behavior should be goal directed. Understanding of behavior requires separation of actual behavior events from the outcomes of these events. Behavioral patterns and tendencies are important for understanding of behavior.

Definitions

□ Ivancevich, Donnelly & Gibson

- Behavior is any observable responses given by a person.

□ Hammer & Organ

- Behavior is what an individual actually does in a given environmental situation.

□ Hersey & Blachard

- The basic unit of behavior is an activity. In fact, all behavior is a series of activities.

Organizational Behavior

- Organizational behavior is the study of what people do in an organization and how their behavior affects organization's performance. It is concerned with the study of human behavior at work.
- It is the systematic study of the behavior of individuals and groups in organizational settings.
- It is concerned with understanding, predicting and managing human behavior in organizations for improving organization's effectiveness.

Basically, OB seeks to answer-----

- Why people do what they do at work in organization?
- How that behavior affects the performance of the organization?

Definition

“OB is the study and application of knowledge about how people as individuals and as groups act within an organization. it strives to identify ways in which people can act more effectively.”

—**Keith Davis and Newstrom**

“Organization behavior is a field of study that investigates the impact that individuals, groups, and structure have on behavior within organizations for the purpose of applying such knowledge towards improving an organization’s effectiveness”.

—**Stephen P. Robbins**

Approaches to Organizational Behavior

Human Resources Approach

Contingency Approach

Productivity Approach

Systems Approach

Inter-Disciplinary Approach

Human Resources Approach

This approach recognizes the fact that people are the central resource in any organization and that they should be developed towards higher levels of competency, creativity, and fulfilment. People thus contribute to the success of the organization.

The human resources approach is also called the supportive approach because the manager's role changes from control of employees to active support of their growth and performance.

The supportive approach contrasts with the traditional management approach.

In the traditional approach, managers decided what employees should do and closely monitored their performance to ensure task accomplishment.

In the human resources approach, the role of managers changes from structuring and controlling to supporting.

Contingency Approach

The contingency approach (sometimes called the situational approach) is based on the premise that methods or behaviors which work effectively in ONE situation fail in another.

For example, Organization Development (OD) programs, the way work brilliantly in one situation but fail miserably in another situation.

Results differ because situations differ; the manager's task, therefore, is to identify which method will, in a particular situation, under particular circumstances, and at a particular time, best contribute to the attainment of the organization's goals.

Productivity Approach

Productivity means the numerical value of the ratio of output to input. Higher the value of this ratio, greater is the efficiency and effectiveness of the management. The traditional concept of productivity was concerned with economic inputs and output only.

But nowadays human and social inputs and outputs are equally important. Productivity, a significant part of organizational behavior decisions, is recognized and discussed extensively. These decisions relate to human, social and economic issues. For example if better organizational behavior can reduce worker's turnover or the number of absentees, a human output or benefit occurs.

Systems Approach

The systems approach is of the view that an organization is a powerful system with several subsystems which are highly and closely interconnected. Any action taken to solve the problems in one subsystem will have its effect on the other subsystems as well; since all the parts of the organization are closely connected.

Thus, this approach gives the managers a way of looking at the organization as a whole, whole group, and the whole social system. Systems approach has become an integral part of modern organizational theory. Organizations are termed as complex systems comprising of interrelated and interlocking systems.

Components of an Organizational System

The system approach envisions the organization as made up five components:

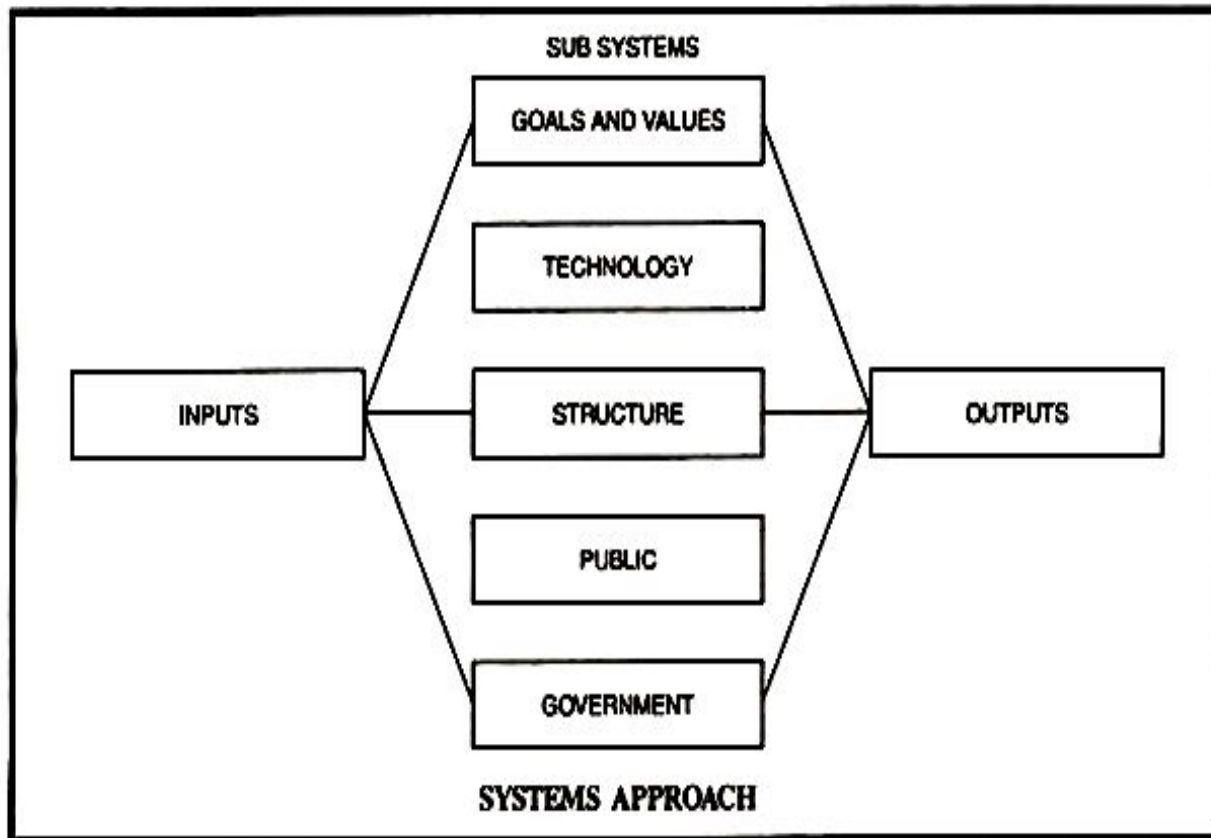

Inputs - Raw Materials, Human Resources, Capital, Information, Technology

A Transformational Process - Employee Work Activities, Management Activities, Operations Methods

Outputs - Products or Services, Financial Results, Information, Human Results

Feedback - Results from outputs influence inputs.

Systems Approach

shutterstock.com • 766905115

Characteristics of the System Approach

The following are the characteristics of the System Approach to Management:

Sub-Systems - Each organization is a system made up of a combination of many sub-systems. These sub-systems are inter-related.

Holism - Each sub-system works together to make up a single whole system. Decisions made in any subsystem affect the entire system.

Synergy - The collective output of the whole system is greater than the sum of output of its sub-systems.

Closed and Open Systems - The whole organization is an open system made up of a combination of open and closed sub-systems.

System Boundary - The organization is separate from the external environment made up of other systems.

+

Inter-Disciplinary Approach

Organizational behaviour is an integration of all other social sciences and disciplines, such as psychology, sociology, organizational theories, etc.

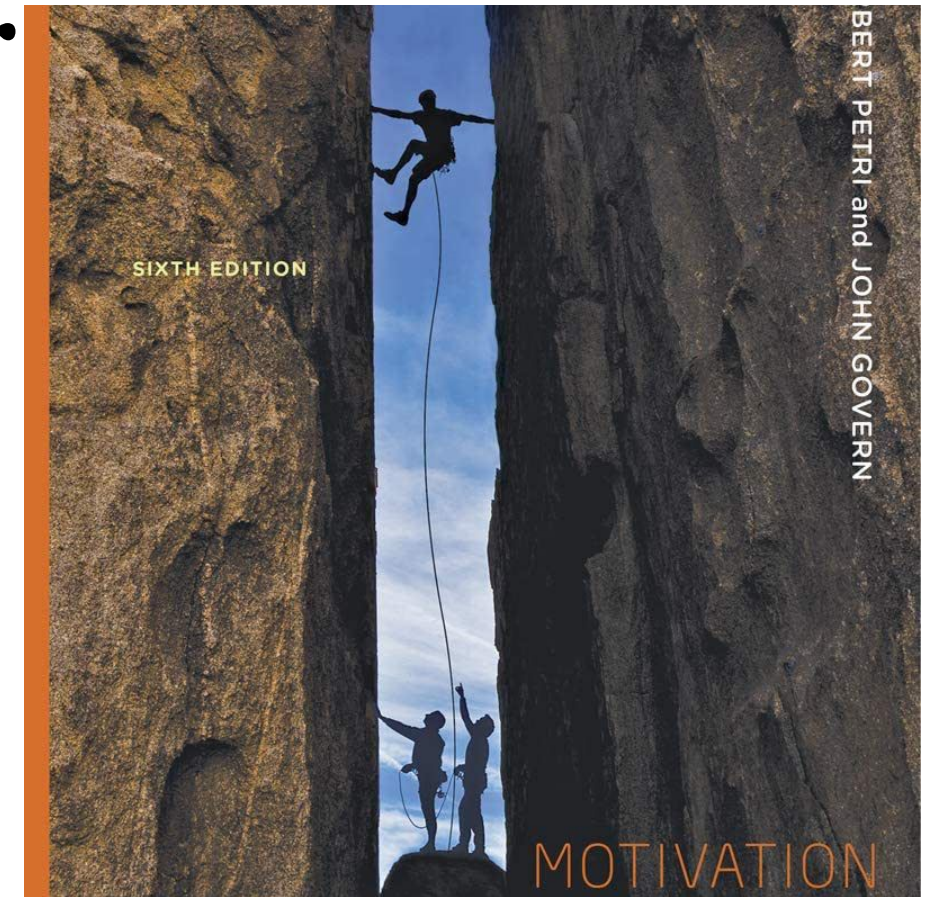

They all are interdependent and influence each other.

Emerging Trends in Organizational Behavior

Organizational Behaviour (OB) is not that Organizational Behaviour (OB) which was studied before. There are emerging various trends in OB. With the passage of time managers are adopting different models or practice to manage the behaviour of employees within the organization. Here we discuss the trends in OB presented by Keith Davis. These trends are as follows:

- ❑ Open System
- ❑ Human Orientation
- ❑ Distribution of Power
- ❑ Intrinsic Motivation
- ❑ Balanced Focus
- ❑ Self-disciplined
- ❑ Leadership and team support
