- Reinforcement Theory

Concept of Motivation

- Motivation is a basic psychological process. It gives purpose and direction to behavior. It induces employees to use their skills and abilities to perform effectively. It is an inner force that energize people into action.
- Motivation starts with need. Need is physiological or psychological deficiency. Needs activate drives or motives. The need for food becomes a hunger drive. The drive is aimed at goal or incentives. The incentives restores the physiological or psychological balance. The interacting relationships among needs, drives and incentive serve as the foundation of motivation process.

+

- According to Koontz and Weihrich; “Motivation is to do those things which satisfy drives and desires and induce the subordinates to act in a desired manner.”
- According to Fred Luthans; “Motivation is a process that starts with a physiological or psychological deficiency or need that activates behavior or a drive that is aimed at a goal or incentive.”
- According to Ricky Griffen; “Motivation is the set of forces that causes people to behave in certain ways.
- Motivation thus, defined as a combination of forces inspiring a person at work to intensify his/her willingness to use his/her capabilities for the achievement of desired goals. It is an act of inducement. Motivation induces people for higher performances. It reduces employee accidents, turnover and absenteeism.

Characteristics of Motivation

Psychological aspects: Motivation is a psychological aspect of management. It is the internal feelings which arise from the needs and desires of a person.

Goal Oriented: Motivation causes goal directed behavior. Feeling of needs by the person causes him/her to behave in such a way that he/she tries to satisfy himself/herself. Which trigger to achieve desired goal.

Continuous Process: Motivation is a continuous process. When one particular need is fulfilled, another need will activate. Thus, motivation is an unending process.

Complex and Dynamic Process: Motivation is complex and dynamic. Individual differ in their needs and wants. Same motivation techniques may not fit for all. Thus, ever changing needs are challenge for the mangers.

Pervasive: Motivation covers all level of manger in an organization. Each and every level must be motivated towards work for the higher performance.

Positive and Negative: Motivation may be positive or negative. Positive motivation means inspiring people to work better by providing rewards and incentive such as high payment, promotion, recognition etc. Negative motivation means forcing people to work by punishing them such as: demotion, cut-of-salaries, job termination etc.

Intrinsic and Extrinsic: Intrinsic motivation in job related which includes job enrichment, participation, recognition etc. Whereas Extrinsic motivation is money related .It consist of salary, incentive etc.

Theories of Motivation

Several Theories have been developed about motivation. They can be classified as follows:

- a) Need-based Theories
 - Hierarchy of Needs Theory
 - Motivation-Hygiene Theory (Frederick Herzberg)
 - McClelland's Theory of Needs (David McClelland)
- a) Process-based Theories
 - Equity Theory (J. Stacy Adams)
 - Expectancy Theory (Victor Vroom)
 - Reinforcement Theory (B.F. Skinner)
 - Goal-setting Theory (Ed Locke)

Hierarchy of Needs Theory

This theory was developed by Abraham Maslow. This theory states that satisfaction of Needs motivate individual behavior. It hypothesizes that people have a set of five needs which are arranged in a hierarchy.

Physiological Needs: They are the basic survival needs for food water, clothing, shelter, sex etc. They are the lowest order and assume top priority.

- Salary provides a means to satisfy physiological needs in organization.

Safety Needs: They are needs for security and protection from physical and emotional harm.

- Provident fund, pension, health insurance satisfy the safety needs in organization.

Social needs: They are the needs for affection, belongingness, companionship and social acceptance.

- Peers, informal groups, employee clubs etc. satisfy the social needs

Esteem needs:

At this level, it becomes increasingly important to gain the respect and appreciation of others. People have a need to accomplish things, then have their efforts recognized. In addition to the need for feelings of accomplishment and prestige, esteem needs include such things as self-esteem and personal worth.

People need to sense that they are valued by others and feel that they are making a contribution to the world. Participation in professional activities, academic accomplishments, athletic or team participation, and personal hobbies can all play a role in fulfilling the esteem needs.

Self-Actualization Needs

At the very peak of Maslow's hierarchy are the self-actualization needs. Self actualizing people are self-aware, concerned with personal growth, less concerned with the opinions of others, and interested in fulfilling their potential.

"What a man can be, he must be," Maslow explained, referring to the need, people have to achieve their full potential as human beings.

Maslow's said of self-actualization: "It may be loosely described as the full use and exploitation of talents, capabilities, potentialities, etc. Such people seem to be fulfilling themselves and to be doing the best that they are capable of doing. They are people who have developed or are developing to the full stature of which they capable."

Motivation-Hygiene Theory (Frederick Herzberg)

In the late 1950s, Frederick Herzberg, considered by many to be a pioneer in motivation theory, interviewed a group of employees to find out what made them satisfied and dissatisfied on the job. He asked the employees essentially two sets of questions:

- Think of a time when you felt especially good about your job. Why did you feel that way?
- Think of a time when you felt especially bad about your job. Why did you feel that way?

From these interviews Herzberg went on to develop his theory that there are two dimensions to job satisfaction: motivation and “hygiene”.

Hygiene issues, according to Herzberg, cannot motivate employees but can minimize dissatisfaction, if handled properly. In other words, they can only dissatisfy if they are absent or mishandled. Hygiene topics include company policies, supervision, salary, interpersonal relations and working conditions. They are issues related to the employee's environment.

Motivators, on the other hand, create satisfaction by fulfilling individuals' needs for meaning and personal growth. They are issues such as achievement, recognition, the work itself, responsibility and advancement. Once the hygiene areas are addressed, said Herzberg, the motivators will promote job satisfaction and encourage production.

McClelland's Theory of Needs

The Three Needs Theory, also known as need theory, is the best-known theory of David McClelland, a Harvard professor who spent thirty years conducting research on motivation. He sought to understand human nature and develop tools to measure how people make choices.

He divided needs as follows:

- The Power Motive
- The Achievement Motive
- The Affiliation Motive

+

●

The Power Motive

If an individual's predominant motive is power, they are motivated to influence others and take control. While the extreme example of Hitler in Nazi Germany may come to mind, this motive actually takes on a more mild form of coach or leader. They do not seek to implement a dictatorship but hope to motivate others, delegate responsibility and influence those around them.

A coach is a good example because it perfectly illustrates the idea of letting the players (or in this case, employees), do their job while they assess the situation and make decisions. The players and employees are aware of their responsibilities and are highly skilled to perform them.

McClelland found that power-motivated individuals were best suited for leadership positions within a company. If they were able to effectively delegate tasks in the workforce, they were often able to be successful leaders. This does not mean that all power-motivated individuals will make good leaders. Each personality is unique and those who are aggressive and

The Achievement Motive

If an individual's predominant motive is achievement, they are motivated to do better for the sake of doing so. They hope to exceed expectations and are pleased when they surpass their peers. These individuals like challenges and want to be in charge of their success.

Achievement-oriented individuals will change the situation or the location if they feel like it is not meeting their needs. They do not like working in groups because they do not like having limited control over the outcome. Instead, they prefer to do work where the results are clear and visible.

The Affiliation Motive

If an individual's predominant motive is affiliation, they are essentially motivated by social connections. They are primarily motivated to fit in and please others, and value their relationships with their peers. These individuals appreciate familiar situations and are unlikely to leave their work location. They also do not like working alone and try to avoid disappointing their coworkers and managers at all costs.

Even though affiliation-motivated individuals work well in a team, they are often not the best employees. They are not motivated to do better as they are content to stay in their position. There is no drive to improve their employee status or their personal position, which makes them, in effect, the least effective workers.

Equity Theory (J. Stacy Adams)

Adams' Equity Theory of Employee Motivation (also known as the Equity Theory of Motivation) posits that employees are motivated when they believe they are receiving a fair reward for their work. This theory was developed by J. Stacey Adams in 1963 and has since been used to explain employee behavior and motivation.

Adams' Equity Theory suggests that employees compare their own inputs and outputs (e.g., effort and rewards) to those of others, and when there is a perceived imbalance, they will act to restore equity. It states that employees are motivated to keep their own perceived fairness levels in balance with those around them. This means that if they feel they are being treated unfairly, they will be less motivated to work hard.

What are the three components of Adams' Equity Theory?

The three components of Adams' Equity Theory are inputs, outputs, and comparisons.

- Inputs refer to the resources that employees bring to the job, such as their education, experience, and skills.
- Outputs refer to the resources that employees receive from the job, such as salary, benefits, and recognition.
- Comparisons refer to the process of comparing one's own inputs and outputs to those of others.

Adams' Equity Theory is based on the premise that employees seek to maintain equity between their inputs and outputs. When there is a perceived inequity, employees will take action to restore equity.

+

Expectancy Theory (Victor Vroom)

[Victor Harold Vroom](#) created the Expectancy Theory of Motivation in 1964. His study of psychology has shed light on how people behave in the workplace, particularly when it comes to motivation, leadership and decision-making.

It works on the assumption that people will choose to maximize pleasure and minimize pain. This means that people will behave in a way that results in the best outcome or reward.

The theory is dependent on the idea that the more an employee values the outcome, the more motivated they will be to achieve it. The more effort they put in to succeed, the more certain they are of getting that satisfying reward.

+

To make the connection between motivation, effort and performance, Expectancy Theory has three variables: **Expectancy**, **Instrumentality** and **Valence**. **Expectancy (E)**

If an employee puts in the effort, they **expect** a certain result. If they do not get that result, they will not be motivated to make the effort again and so will not be satisfied with the outcome.

How can managers help employees get the results they expect?

- Make sure the employee has the tools and time
- Assign an employee that already has or will gain useful skills
- Be available to provide support and encouragement

Instrumentality (I)

Employee might make the effort and get the expected result but if they do not believe that the result is **instrumental** in getting the reward, they will not be motivated. And so the outcome is not achieved and employee is not satisfied.

How can managers help employees understand that the result is instrumental in getting a satisfactory outcome?

- Be clear about what the reward is and how to achieve it
- Give staff an outcome they value so they can trust that their effort is important
- Be open about how rewards are allocated

Valence (V)

Valence is how much the outcome is valued, if at all. The more an employee values a certain reward, the more satisfied they will be with their efforts.

A reward doesn't have to be a grand gesture, it just has to be meaningful to the employee – whether that's a bonus, extra time off or simply a bit of recognition.

So, the chain (or equation) of Vroom's Expectancy Theory is as follows:

Motivational Force (MF) = Expectancy (E) x Instrumentality (I) x Valence (V)

For example, say a manager tasked their employee with producing an advertising campaign, which would get them the bonus they wanted as a reward (Valence).

According to Vroom's Expectancy Theory, the employee must believe the task is achievable, in order for them to put the effort into it. If the task is doable, the employee will be keen to perform well in anticipation of the bonus (Expectancy).

The employee must also believe that the effort they put in will get them the desired outcome (Instrumentality), so the organisation must deliver

Reinforcement Theory (B.F. Skinner)

B.F Skinner's work is built on the assumption that behaviour is influenced by its consequences. Reinforcement theory is the process of shaping behavior by controlling consequences of the behavior.

Reinforcement theory proposes that you can change someone's behaviour by using reinforcement, punishment, and extinction. Rewards are used to reinforce the behaviour you want and punishments are used to prevent the behaviour you do not want. Extinction is a means to stop someone from performing a learned behaviour. The technical term for these processes is called '*operant conditioning*'

Key Concepts of Reinforcement Theory

MOTIVATION

+

The fundamental concepts of this theory are reinforcement, punishment, and extinction.

Reinforcement can be divided into positive reinforcement and negative reinforcement as follows:-

Positive reinforcement occurs when a pleasant event occurs, such as praise, pay etc. If a salesperson performs well, that salesperson may receive a bonus, which reinforces the desire to make sales because of the positive consequence of doing so.

Negative reinforcement occurs when a negative consequence is withheld if the behaviour you desire is demonstrated.

Eg. Imagine a student, Ambika, who is afraid of public speaking. Every time Ambika has a presentation in class, she experiences intense anxiety. However, her teacher implements a strategy where if she completes her presentation without stuttering or stopping, the teacher reduces the amount of homework she has for the following week..

Punishment occurs when you impose a negative consequence to reduce an undesirable behaviour. While negative reinforcement involves withholding a negative consequence to encourage a desirable behaviour, punishment is imposing a negative consequence to discourage an unwanted behaviour.

For example, getting your wages docked for being late to work is a punishment that is imposed on late workers to discourage workers from being late - an undesirable behaviour. However, punishment is often used as a last resort in an attempt to reshape the employee's behaviour because it can result in bad consequences and create more pressure and stress for the employee.

Extinction is a means to stop someone's learned behaviour. You attempt to extinguish a behaviour by withholding the positive reinforcement that encouraged the behaviour. In other words, it refers to the gradual decrease in the frequency or intensity of a behavior when it is no longer reinforced.

For example, let's say that you manage a production facility that had a hard time keeping up with orders for the past few months. You used overtime pay as a positive reinforcement to bring workers in on weekends and to delay holidays. Now that you have the orders under control, you stop approving overtime. Their learned behaviour has been extinguished.

Goal-setting Theory (Locke and Latham)

In 1990, Locke and Latham published their seminal work, "A Theory of Goal Setting & Task Performance." In this book, they repeated the need to set specific and difficult goals, while outlining five other characteristics for successful goal setting.

Lock and Latham's Five Principles:

CLARITY

- Setting clear goals
- When your goals are clear, you know what you're trying to achieve. You can also measure results accurately, and you know which behavior to adapt
- SMART can help (Specific, Measurable, Attainable, Relevant, Time-bound)
- What metrics will you use?

CHALLENGING

- Difficult goals lead to higher effort and performance
- Challenging goals energize you!

COMMITMENT

- Make sure you and your team will commit to the goal (believed it is achievable, consistent with your values and ambitions, and credible)
- Use visualization to imagine how life will look once you have achieved your goals
- Make a public commitment!

COMPLEXITY

- Consider the complexity and how it is related to your context
- Do you need to set a more appropriate deadline to prevent becoming overwhelmed? ~Break large, complex goals down into smaller sub-goals.
- Set *learning goals* for very complex goals

FEEDBACK

- Important to gauge your progress
- Gives you the opportunity to clarify expectations and adjust the difficulty of goals
- Schedule feedback intermittently
